

EOCENE VERTEBRATES FROM SINYU, KIANGSI PROVINCE

CHOW MIN-CHEN

(*Institute of Vertebrate Paleontology, Academia Sinica*)

ABSTRACT

This is a short note on the few vertebrate fossils found from the red conglomeratic beds of Sinyu (=Xinyu), Kiangsi Province. The fossils include few fragmentary teeth and bones of *Crocodylus*, *Emys*, *Anosteira*, *Trionyx*, and *Coryphodon*, etc. indicating that the fossil bearing beds are of Early or Middle Eocene age. These are the first Tertiary vertebrates known in that province. The presence of *Coryphodon* is interesting because it represents the first occurrence of this important genus of archaic ungulates in south China.
